

1. Best Practices for using vibe-coding tools.
2. Tokenization - Byte Pair Encoding
3. Ai Agents and Agentic AI

Three Ground Rules:

1. You're a senior engineer, and the tool is a fast, eager junior. This junior types faster than you, knows more APIs, it has ZERO accountability, no memory of why the system exists the way it does.
2. If you can't verify/understand the code it generates, never ever deploy it.
3. Context it's a very rare resource, more important than your time, or model's intelligence.

SPECTRUM

Less delegation

More Delegation

Inline Completion → Chat function → Agent → Async
describe, Agent.
+
creates & looks assign
multi file, tools a PR
ticket
whole codebase
solve unalter

Opus 4.8/GPT - 5.5 neck to neck for coding
Gemini 3.5 reasoning and data
GROK 4.3 cheapest with multi tool usage.

How to create good quality harness:

1. Specify exactly the feature/product you want to implement -> ask for a given create a very very detailed prd.md
2. Point/Reference to any code-base you currently have -> Reference your code.
3. Design/Ask for tests, for every phase of your project. -> Verification Loop.
4. Ask the Agent to keep you involved in the project -> any key design decisions.
5. Don't let them touch any production secrets.

Context rot

LLM performance degrades as it approaches the context window.

For given features, reflect and come up with about 8-10 different approaches for solving it, and then distill it down to 2-3 and then discuss with me.

For given bug, reflect and come up with about 8-10 different reasons why the bug may have happened, then distill it down to 2-3 most likely scenarios and then discuss with me.

For every task, do a /clear

Explore -> Plan -> Implement -> Commit.
